Dear DigitalOcean Recruiting Team,

I am writing to express my strong interest in the Senior Technical Account Manager position at DigitalOcean. As an Implementation Architect and Systems Analyst holding a Master of Science in Quantitative Methods and Modeling and transitioning permanently to the Seattle market, I operate as an intentional technical "Bone-Setter", ie someone who specializes in auditing complex workflows, stabilizing data infrastructure, and translating high-level system capabilities into sustainable operational realities.

DigitalOcean's core mission of simplifying cloud infrastructure for the global developer community resonates deeply with how I evaluate technology. In an enterprise landscape frequently bogged down by proprietary vendor lock-in, abstract configurations, and opaque environments, your emphasis on lean, accessible, and developer-first scalability represents the exact framework where I choose to focus my professional execution.

My professional background directly addresses the multi-stakeholder and architectural challenges managed daily by a Senior Technical Account Manager:

- **Enterprise System Auditing & Alignment:** During an intensive enterprise-wide Epic EHR migration for an 18,000-patient health ecosystem, I served as a strategic technical advisor reporting directly to executive leadership from my position as a union delegate. My mandate centered on auditing abstract operational friction, forcing complex system configurations to align directly with front-line clinical realities, and protecting long-term data fidelity under strict regulatory constraints.
- **High-Friction Escalation Management:** I resolved 10–20 high-friction challenges daily rooted in how systemic infrastructure failed the people using it. My approach to crisis resolution stems from a recognition that complex systems often default to protecting their own internal institutional structures rather than serving the end-user. By deliberately shifting focus away from an organization's bureaucratic self-preservation and prioritizing front-line human outcomes, I was able to cut through systemic inertia, isolate friction points, and build practical workarounds that forced rigid frameworks to serve actual human needs.
- **Active Cloud Infrastructure Execution:** My public technical portfolio demonstrates an architecture-agnostic approach to data systems. My CIP Project build showcases hands-on experience designing serverless Python pipelines deployed via Google Cloud Run, utilizing streaming JSON ingestion and automated schema mutation logic into Google BigQuery, and compiling raw sources into a conformed dbt Kimball star schema. Concurrently, the Phase 1 MVP of my Healthcare Access Routing Engine (The WHO Project) utilizes an AWS serverless pipeline (S3/Lambda) to eliminate transit-accessible referral bottlenecks.

While the immediate prototyping phase of my routing engine leverages conventional enterprise environments for rapid data validation, I am intentionally scoping its Phase 2 infrastructure migration to deploy directly onto DigitalOcean's App Platform and Spaces. This architecture choice is driven by a strict ethical mandate as much as a technical one. I view data infrastructure as a direct extension of my active humanism; I refuse to anchor my technical labor within cloud monopolies that profit from defense-sector warfare contracts, state-sanctioned violence, or oligarchic capital. Transitioning to DigitalOcean is a conscious decision to partner with an independent, community-centric ecosystem that respects ethical boundaries, ensuring that my infrastructure explicitly serves a mission-focused end where professional execution and global human rights advocacy are fundamentally inseparable.

I thrive in cross-functional environments that demand a bias for action, a passion for open-source systems, and a powerful sense of responsibility for customer outcomes. I look forward to discussing how my background in systems translation and data governance can protect, optimize, and scale cloud deployments for DigitalOcean's key business accounts.

Thank you for your time, consideration, and dedication to keeping the cloud simple.

Best regards,
Preston Carey Leslie
