To the Systems Evolution, Inc. (SEI) Seattle Hiring Team,

The long-term value of a data modernization initiative depends on more than raw code; it depends on the absolute integrity of the underlying data models and an elite framework for stakeholder translation. As an incoming Seattle resident, a recent Master of Science graduate in Quantitative Methods and Modeling from Baruch College (Zicklin School of Business), and a veteran Systems Implementation Architect, I operate as a "bone-setter" for human-centric data infrastructure. I specialize in bridging the critical gaps between complex data governance, technical execution, and cross-functional C-suite strategy.

SEI's emphasis on ethics, accountability, and consultants who hold true to their values in difficult situations resonates deeply with my professional identity as an "Honest Advisor." During an enterprise-wide Epic migration for an 18,000-patient ecosystem, I served as a strategic technical liaison reporting directly to executive leadership. My mandate was to audit user configurations, identify data governance gaps, and uncover structural friction points shielded by middle management. By standardizing abstract operational realities into actionable technical specifications, I protected front-line data fidelity and improved database conflict resolution speeds by 50%.

A high-performance consultant must seamlessly balance business acumen with a flexible technical engine across varied cloud environments. As detailed on my live portfolio (prestoncarey90.github.io/portfolio/), my data architecture execution is driven by real-world systems translation. Through the Complaints & Inspections Project (CIP), I deployed dbt and SQL to ingest and transform millions of rows of municipal infrastructure data into a structured star schema to drive continuous service improvement. Separately, through my serverless AWS (S3/Lambda) infrastructure build for the Warm Hand-Off (WHO) initiative, I am actively designing a Python-driven data bus to process flat JSON payloads and normalize hundreds of thousands of state and federal provider records. This architecture has been operationally validated by front-line clinical triage teams and has earned future launch integration invitations across local provider listserv networks.

With 14 years of total operational leadership, including a proven history of dynamically scaling cross-functional teams of up to 100+ personnel under tight execution windows, I excel at breaking complex programs into actionable pieces. I am eager to bring this combination of technical grit, strategic governance, and relentless commitment to operational transparency to SEI's core capabilities. I look forward to discussing how my systems science background can support your Seattle clients' most strategic data initiatives.

Best regards,
Preston Carey Leslie
