Dear Energy Trust of Oregon,

High-impact program evaluation requires a rare combination of quantitative precision, structural logic, and the operational agility to translate complex data into real-world performance. As an analytical professional with a Master of Science in Quantitative Methods and over a decade of experience navigating complex operational systems, I am highly motivated to contribute to the Planning & Evaluation team at Energy Trust of Oregon.

Energy Trust's commitment to transparency through the publication of its Measure Approval Documents mirrors my own professional dedication to data integrity and structural fidelity. Throughout my career, I have specialized in stabilizing high-friction environments by serving as the strategic bridge between complex data systems and multi-stakeholder operations. My background includes directing full-lifecycle logistics for large-scale operations, auditing complex data structures and provisioning logic, and dynamically scaling execution teams of up to 100+ contingent personnel and subcontractors to deliver on rigorous, high-stakes mandates.

I excel at the intersection of granular statistical analysis and macro-level strategic planning. Whether building cost-benefit analyses, troubleshooting intricate spreadsheet data, or evaluating baseline operational shifts against evolving regulatory standards, I ensure that every approved framework is both technically sound and execution-ready. Furthermore, my experience presenting complex analytical findings to non-technical audiences aligns directly with your need for a subject matter expert who can synthesize technical issues into clear, concise applications for public and regulatory groups.

I am eager to bring my quantitative training, operational resilience, and dedication to clean energy access to this role. Thank you for your time, equity-forward review, and consideration.

Sincerely,

Preston Carey Leslie
