To the Concora Credit Hiring Team,

A high-performance financial data ecosystem requires more than raw pipeline code; it depends on the absolute integrity of the underlying data models and an innate understanding of how finance professionals leverage that data. As a Data & Systems Analyst, a recent Master of Science graduate in Quantitative Methods and Modeling from Baruch College (Zicklin School of Business), and an incoming Portland resident, I specialize in building the end-to-end data architectures and optimized pipelines that transform complex datasets into institutional assets.

Concora's mission to help non-prime customers do more with credit requires a data engine built on structural truth, not legacy operational noise. My technical foundation is rooted directly in modern database design and dimensional modeling, backed by academic coursework in Corporate Finance and Investment Analysis. My engineering execution is driven by real-world systems translation. Through my cloud-based analytics platform, I deployed dbt and SQL to ingest and normalize over 400,000 high-volume municipal records into a structured star schema. Separately, through my Warm Hand-Off (WHO) infrastructure initiative, I am actively architecting a serverless AWS (S3/Lambda) data bus designed to process flat JSON payloads and normalize disparate provider API endpoints. This build has been operationally validated by front-line clinical triage teams and has earned future launch integration invitations across local provider listserv networks.

The impact of a Data Engineer, however, is realized in their ability to partner with non-data users and senior leadership to solve complex process friction. Throughout my five years driving operational triage for high-concurrency environments, I served as a strategic technical liaison reporting directly to C-suite executives. My focus was identifying the operational root causes of database degradation, auditing user configurations, and translating abstract business needs into high-fidelity, normalized data models. This allowed me to reduce average conflict resolution times by 50% while safeguarding front-line data integrity under strict compliance frameworks.

I am moving to the Portland area this June and am eager to bring my 14 years of leadership, financial domain fluency, and rigorous analytical background to Concora Credit's Finance Department. I look forward to discussing how my experience in pipeline optimization, serverless architecture parsing, and technical translation can support your team's data modernization initiatives.

Best regards,

Preston Carey Leslie
