Carrix IT Hiring Team
1131 SW Klickitat Way
Seattle, WA 98134

RE: Business Analyst - ERP Systems (Job #26-0600)

Dear Carrix Hiring Team,

Enterprise software platforms are frequently sold as a cure-all for organizational silos, but the reality is that connective digital tissue rarely fixes fractured human workflows on its own. When a major system migration launches without flawless upfront planning, departments often double down on protectionism, weaponize their individual configurations, or retreat to off-book tracking. I am applying for the Business Analyst position because your team explicitly seeks someone comfortable operating where problems are poorly defined, stakeholders must be actively questioned, and operational reality must be clawed back from systemic friction. Having recently completed my Master of Science in Quantitative Methods and Modeling from Baruch College, I am currently unencumbered and prepared to relocate to Seattle immediately to support your team onsite at Klickitat Way on day one.

My background is anchored in ground-level data auditing and managing system navigation through intensive, hands-on problem-solving. During Callen-Lorde's transition from NextGen to Epic, I navigated the core architecture for an 18,000-user ecosystem. Rather than acting as an upfront architect, my role was to audit the source-to-destination field mapping and manage database data quality after the fact to preserve critical demographic layers. Stepping into the operational friction caused by a severe lack of post-migration planning, I engineered a manual tracking system in Google Sheets to capture capacity telemetry and monitor processing bottlenecks. This independent root-cause analysis successfully isolated an unflagged hardware-level constraint, allowing us to stabilize data routing for a new pilot division.

A successful Business Analyst cannot simply be a cheerleader for technology; they must act as a functional diplomat between technical development teams and resistant operations personnel. Across my fifteen-year career, I have routinely managed assignments where requirements were completely fluid. Whether designing conceptual system architectures to map legacy data buses to serverless AWS frameworks or leading structured user acceptance testing (UAT) to minimize service disruptions, my approach relies on compelling storytelling backed by rigorous data auditing. I know how to interpret complex technical specifications for non-technical staff and, conversely, how to translate frontline operational friction into structured business requirements, localized process runbooks, and actionable user manuals.

Carrix needs an investigator who understands that basic system engineering and architecture standards are only as effective as the human adoption driving them. I bring the mathematical discipline of a quantitative modeler and the thick skin of an operations specialist who has spent years negotiating peace treaties between corporate silos. I am eager to bring this pragmatic approach to your Carrix IT projects and can accommodate any immediate interview timeline.

Thank you for your time, consideration, and dedication to building resilient systems.

Sincerely,
Preston Carey Leslie
