Dear Members of the Selection Committee,

I am writing to express my interest in the Senior Technical Account Manager position at Highspot. As an operations specialist and systems modeler holding an MS in Quantitative Methods and Modeling from Baruch College, I serve as a strategic liaison who bridges the gap between data logic, frontline client workflows, and enterprise performance architecture. I am currently executing a permanent, self-funded relocation to the Seattle area and am available for immediate engagement. Highspot's mission to increase sales productivity through an intuitive, AI-augmented platform requires a technical advisor who understands how sophisticated enterprise tools interact with real human behaviors on the ground. Bringing a 15-year foundation in high-concurrency client relationship management, I operate as a functional "Bone-Setter" for organizations, I specialize in looking at technology from the end-user's perspective, diagnosing hidden systemic blockages, and translating complex platform data into meaningful business outcomes.

My graduate portfolio and professional history directly align with the core analytical and client-advocacy demands of your mid-to-upper-market accounts. On the technical delivery track, my background bridges script-based analytics with modern cloud frameworks. For the cloud-native Complaints & Inspections Project (CIP), I engineered Python extraction microservices deployed on Google Cloud Run to automate streaming data intake from public Socrata APIs. To protect downstream visual dashboards, I authored self-healing schema-mutation logic and automated offset pagination tracking via BigQuery COUNT(*) queries, utilizing rigorous regular expression cleansing inside dbt transformation models to compile disparate strings into a unified star schema. Furthermore, my architectural design training is grounded in user-experience optimization; during the design phase of my ongoing WHO (Warm Hand-Off) Project, I evaluated frontline user latency barriers to scope a serverless AWS OLTP Web Application concept (S3/Lambda/JavaScript) optimized for real-time, low-friction performance. This structural database literacy means I can effortlessly navigate Highspot's platform analytics, evaluate customer health scores, help non-technical clients interpret adoption trends, and translate usage data into clear value narratives.

This quantitative capability is balanced by extensive experience managing frontline user operations and high-stakes stakeholder networks. When an aggressive provider expansion over-saturated a small healthcare operations team at Callen-Lorde, I engineered an ad-hoc tracking infrastructure in Google Sheets to log daily task volumes. My audits isolated a critical 99-voicemail capacity ceiling that was silently dropping patient calls, providing the empirical proof needed for executive leadership to launch an entirely new call center division where I subsequently managed training and onboarding. As an elected 1199SEIU Union Delegate representing over 300 personnel, I regularly partnered directly with C-suite executives to interpret complex master agreements, manage structural grievances, and maintain operational continuity under tight compliance frameworks, level-headed diplomacy I first honed in premium hospitality environments managing real-time logistics, such as 11 concurrent tables during peak demand at Jean-Georges' ABCV.

I am a self-directed, customer-centric technical specialist who thrives in dynamic environments that demand structural discipline. I am eager to apply my quantitative foundations to Highspot's Seattle team to help drive platform adoption, manage expectations, and secure renewals across your premium enterprise portfolio. Thank you for your time, consideration, and leadership.

Best regards,

Preston Carey Leslie
