Dear RevenueCat Team,

I am writing to express my strong interest in the Senior Customer Success Manager position within your Growth and Marketing division. I am not a traditional SaaS salesperson, and I do not believe in tracking down cheap wins by upselling clients on tools they do not need. My professional execution centers on value realization: ensuring that a customer is extracting clear baseline utility from a product so that their return on investment demonstrably exceeds their cost. Holding a Master of Science in Quantitative Methods and Modeling from Baruch College, I offer a unique combination of structural data literacy and a fifteen-year foundation running high-concurrency client-facing environments.

Your job description notes that traditional customer success theater is not enough for where RevenueCat is going. That focus on data-backed transparency deeply resonates with my professional ethos. My background in hospitality taught me that real account health and long-term retention are built entirely on radical honesty. When managing client experiences at high-end venues like Jean-Georges' ABCV, if a particular offering did not genuinely align with my preferences, I provided direct, nuanced caveats because I valued Chef Harden's craft and artistry alongside our customer's long-term trust over a one-time check size. I approach digital infrastructure with that exact same developer-first transparency. I want to look deep into an account's core product usage telemetry, map their unique customer context, understand their internal technical constraints, and ensure our architecture actively drives their subscription growth.

My technical engine is built on translating complex data requirements across cross-functional engineering teams. For my graduate data warehousing course, I developed a dbt transformation architecture managed via dbt Cloud to normalize streaming data layers into conformed star schemas. This training means I comfortably speak the language of APIs, webhooks, and schema mutations natively. I understand enough backend architecture to know when technical correctness matters to a mobile app developer without becoming a relay layer that blindly routes questions to engineering. Furthermore, I am highly adept at recognizing repeating patterns of friction and turning them into scalable leverage. During an intensive enterprise platform migration across an 18,000-user ecosystem at Callen-Lorde, I was heavily consulted by management to translate repeated user bottlenecks into the exact requirements needed to build localized workflows and system runbooks. These documentation assets reduced issue resolution latency by 50% and flattened task turnaround cycles down to 48 hours.

RevenueCat is built on an unusually elegant incentive model: when your developers make money, you make money. I am eager to bring my combination of quantitative data fluency, cross-functional orchestration skills, and uncompromising consultant integrity to your managed account portfolio. Thank you for your time, structural consideration, and for building a remote culture that values saying what you mean.

Sincerely,

Preston Carey Leslie
