Dear Members of the Selection Committee,

I am writing to express my enthusiastic interest in the contract Solutions Analyst position. As a systems-oriented data translator holding an MS in Quantitative Methods and Modeling from Baruch College, my professional focus centers on optimizing software workflows, validating data integrity, and bridging the gap between clinical stakeholders and backend database architecture. I am currently executing a permanent, self-funded relocation to Seattle with immediate, unencumbered availability to support your Life Sciences partners for this 4.5-month term.

Truveta's vision of saving lives with data requires an analyst who respects the complex, messy realities of Real-World Data (RWD). My background directly fulfills the rigorous clinical and technical requirements of your Partner Solutions queue:

- **EHR Data Operations & Anomaly Triage (5 Years):** During an enterprise-wide Epic EMR migration for an 18,000-patient network at Callen-Lorde, I audited frontline data baselines and resolved 10–20 critical system blocks daily. I was formally commended by leadership for my ability to translate complex user friction and behavioral incident data into objective, fact-driven system requirements for database teams. I specialize in isolating data degradation and navigating complex PII/HIPAA compliance frameworks.
- **Systems Triage & Capacity Modeling:** When rapid clinical expansion over-saturated frontline staff, I engineered an ad-hoc tracking infrastructure in Google Sheets to capture capacity metrics. I isolated a critical 99-voicemail hardware capacity ceiling that was causing automated telephonic routing failures, delivering the empirical proof required for executive leadership to approve and launch a new pilot call center division.
- **Advanced Quantitative Modeling & Code Review:** As the technical lead and code reviewer for an epidemiological data initiative, I orchestrated multi-source ELT pipelines using Python to conform a 186-record messy dataset into 141 high-fidelity ZIP code zones. When an exploratory multiple linear regression (MLR) unmasked a $1.96\times$ generalization gap due to multicollinearity, I directed our strategic pivot to an offset Poisson generalized linear model (GLM). To protect the model from severe coefficient distortion, I engineered a categorical dummy variable that cleanly isolated the operational variance of a major correctional facility outlier (Rikers Island) without polluting the regional baseline.
- **Data Architecture & Spatial Concept Fluency:** Through my ongoing serverless architecture work on the WHO Project, I manage geospatial and public health datasets. I am actively prototyping a Python data bus to ingest and denormalize mass transit infrastructure coordinates into a flat JSON format optimized for frontend clinical filtering. Furthermore, my cloud infrastructure work on the Complaints & Inspections Project (CIP) demonstrates direct fluency in writing dbt type-normalization logic, automating BigQuery API chinking offsets, and building conformed dimensional star schemas.
- **Labor Fluency & Collaborative Leadership:** As an elected 1199SEIU Union Delegate representing 300+ personnel, I partnered directly with executive leadership to interpret complex agreements and resolve structural grievances. I possess the level-headed composure and cultural agility required to build trusted, collaborative relationships with cross-functional teams, technical developers, and diverse stakeholder networks alike.

I am an action-oriented technical translator who thrives in dynamic environments where data integrity directly impacts human outcomes. I welcome the opportunity to discuss how my clinical domain knowledge and quantitative skills can immediately unblock deliverables for Truveta's life sciences partners. Thank you for your time, consideration, and leadership.

Best regards,

Preston Carey Leslie
