To the Port of Portland Hiring Team,

The success of a major modernization initiative like Port Forward depends on more than just technical specifications; it depends on the integrity of the information reaching senior leadership. As an Implementation Architect and current MS candidate in Quantitative Methods and Modeling, I specialize in "bone-setting" for human-centric infrastructure, ensuring that enterprise platforms are built on operational truth rather than organizational silos.

My professional identity was defined during an enterprise-wide Epic migration for an 18,000-patient healthcare ecosystem. Serving as a technical liaison and elected union leader, I reported directly to the CEO and COO to bridge the gap between high-level strategy and front-line reality. My role was to identify and communicate the inconvenient truths, i.e. systemic failures and configuration misalignments that were being shielded from senior management. By uncovering these operational root causes, I ensured that system implementations stabilized, ultimately improving data conflict resolution speeds by 50%. This experience in driving transparency across a complex organization prepares me to ensure the Port's ERP implementation remains aligned with real-world operational needs.

While my professional background is rooted in high-stakes advocacy and system governance, my technical toolkit is anchored in rigorous quantitative research through two distinct initiatives. I am currently architecting SQL-driven ELT pipelines to bridge public datasets, joining Medicare and Medicaid provider NPIs with geospatial data to resolve complex referral gaps. Separately, I am developing a Python-based NLP tool to modernize qualitative analysis, replacing manual spreadsheet workflows with automated word-frequency modeling to provide the empirical evidence needed for operational change. This combination of operational grit and multi-modal analytical scrutiny allows me to translate between technical teams and non-technical stakeholders, ensuring that data integrity is maintained from the front line to the C-suite.

I am relocating to Portland in June 2026 and am eager to apply my 14 years of leadership to the Port of Portland's modernization efforts. I look forward to discussing how my commitment to operational integrity and systems science can support the long-term goals of the Port.

Best regards,

William Preston 'Carey' Leslie II
