To the Seattle Human Services Department Hiring Team,

I am a veteran Healthcare Implementation Architect and final-semester MS candidate in Quantitative Methods & Modeling at Baruch College, applying for the Strategic Advisor, Evaluation & System Improvement position. I specialize in "bone-setting" for human-centric infrastructure, the critical work of ensuring that complex, cross-system platforms thrive so that older adults and people with disabilities can live with dignity. As I prepare to anchor my career in the Seattle area this June, I am eager to leverage my technical grit and systems-science background as a strategic advocate for the Aging and Disability Services (ADS) division.

My professional ethos is built on the principle of the Honest Advisor. During an enterprise-wide Epic migration at Callen-Lorde, I served as a functional lead and technical liaison for an 18,000-patient ecosystem. Working closely with the CEO and COO through both my clinical and union leadership roles, I identified the critical points where technical silos diverged from clinical reality. By uncovering the operational root causes of data flow failures and translating them into actionable technical specifications, I ensured that system implementations were equitable, stable, and outcome driven. This experience in influencing change across a complex organization, often without direct formal authority, prepares me to drive measurable improvements and accountability within the Care Coordination system.

Strategic advising requires a hybrid of operational grit and technical rigor. While my frontline work focused on systems-level advocacy, my technical toolkit is anchored in my current graduate research. I am currently architecting SQL-driven ELT pipelines specifically designed to transform disparate Medicaid and Medicare datasets into a single Source of Truth for community referrals. This technical engine enables me to build performance infrastructure that identifies disparities and performance gaps, moving beyond reporting and into actionable system redesign. Furthermore, I am applying Python-based NLP to parse qualitative patient-experience data, an initiative aimed at integrating equity-focused evaluation into the core of service delivery.

I am a proactive problem solver dedicated to building structure where it does not yet exist. Whether I am managing high-volume CRM data integrity for The Standard Hotels or co-founding community-based programs like Queer Roots Cinema, my focus remains on creating inclusive, high-performance systems that serve all stakeholders with integrity. I look forward to discussing how my experience in systems science and high-stakes technical governance can support the strategic goals of the Seattle Human Services Department.

Best regards,
William Preston 'Carey' Leslie II
